And Androis and Angulas corresponding to 28 human secreted protein genes, and Angulas -AAEG1513 represent the proteins they encode. AREG1514 -AAEG1544 -AAEG1543 represent the protein fragments or variants. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes the protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the amount of the new genes. Specific uses are described for each of the proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allerdes, neurological disorders (e.g., Alzheimer's diseases, each asthma, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, skin disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to culture of primary tissues, to regenerate tissues, to identify their comparate ligands or binding partners, and in chemotaxis, and in can be used and comparate is a propertine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      as a food additive or preservative to modify storage properties.
Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid molecules encoding 28 human secreted proteins for {\it shoot} proventing, treating or ameliorating medical conditions and

AAD05300-AAD05379 represent cDNAs corresponding to 28 human secreted protein genes, and AAE01436-AAE01513 represent the proteins they encode. AAE01514-FAAE01544 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing, treating or ameliorating medical conditions, e.g., by protein or gene therapy. Pathological conditions can be diagnosed by determining the camount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the cand include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune disorders (e.g., Intemmation, allorages, neurological disorders (e.g., Alzheimer's disease, asthma, ethma, et

skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell colluture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food additive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioinmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      363 ggaacagttggctcacaaattcatcagcccacagttgagaatgtcctttattgttttctc 422

Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postnasis, inflammatory bowel disease, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachearia and autoimmune disease, osteoarthritis, Lyme's disease, cachearia and autoimmune disease, osteoarthritis, Lyme's disease, acahearia and autoimmune disease, osteoarthritis, Lyme's disease, acahearia and stroimmune clupus erythematosus. The nucleic acids are also useful for producing transpenic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in cornsic biology, for diagnostic assays, prognostic assays, pharmacogenomics and for monitoring clinical trials. TANGO colypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a colipped associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   110 aggacccgcgaggaagggaccgcgggatggcgcgtccttgagggtcgtggcgagttcgcgg 169

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervopathy and concainsed neuropathies and central nervous system diseases, auch as alzaheimer's, Parkinson's disease, Mutingfon's disease, amyotrophic cutilisation of the activity changes such as: Immune system suppression, Activin,Anhibin activity, chancer disagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and convergence of the patent did not form part of the printed
                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                      265

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

the 5602 nucleotide sequences defined in the specification, where the

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to a

polynucleotide which comprises a 3'-end sequence, where the

coligonucleotide which comprises a 1'-end sequence, where the

coligonucleotide which comprises at least 15 nucleotides and the combination of

the 5'-end sequence, 3'-end sequence 15 selectide from those defined in

the specification. The primers are useful for synthesising polynucleotides,

particularly full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers are also useful for the

ANH3631 to AAH18412 represent human cDNA sequences; AAH362446 to

AAH3633 to AAH38412 represent human cDNA sequences; and AAH3629.
                                                                                                                                                                                                                                                                                                                                                                SS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   represent oligonucleotides, all of which are used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               uncleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus host diseases, theumatoid arthritis, postriasis, inflammatory bowel disease, septic shock, ulcerative colitis, Cohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cachexia and autoimmune disease, osteoarthritis, Lyme's disease, cachexia and autoimmune clasease e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial cransgenic animals and for TANGO polypeptides themselves. Partial for pharmacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid sequences encoding TANGO-128, 140, 197, 212, 213, 224 and 239 polypeptides useful for the treatment of asthma, rheumatoid arthritis, psoriasis and autoimmune diseases

The present invention describes primer sets for synthesising 5602

full-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oilgo-dT primer and an oilgouncleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oilgonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oilgonucleotide comprises a 3'-end sequence complementary to a
polynucleotide comprises a 1'-end sequence complementary to a
coligonucleotide comprises a 1'-end sequence therefore
the 5'-end sequence/3'-end sequence is selected from those defined in
the 5'-end sequence/3'-end sequence is selected from those defined in
the specification. The primer sets can be used in antisense therapy and
in gene therapy. The primers are useful for synthesising polynucleotides,
particularly full-length cDNAs. The primers are also useful for the
detection and/or diagnosis of the abnormality of the proteins encoded by
converse assily without any specialised methods. AAH03166 to AAH13628 and
AAH13633 to AAH1874 represent human cDNA sequences? AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification the present invention.

Human breast cancer expressed polynucleotide 11500. Human; breast cancer; cell marker; cytostatic; ss. AAL19043 standard; cDNA; 356 (first entry) Homo sapiens 07-DEC-2001 AAL19043; AAL19043 RESULT 

The invention relates to human breast cancer expressed polynucleotides (AALO7544-AAL26789) and methods of assessing whether a patient is affilicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynucleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynucleotides and encoded polypeptides are also useful for isolating compounds with cytostatic New peptide useful as a marker for the diagnosis of breast cancer (MILL-) MILLENNIUM PREDICTIVE MEDICINE INC Wang Y, Steinmann K; Claim 1; Page 2056; 3695pp; English. 2000US-0192099. 2000US-0193480. 2000US-0205230. 2000US-0211315. 2001WO-US00798 2000US-0189167 2000US-0220534 2000US-0176077 WPI; 2001-451856/48. (AALO7544-AAL26789) and methods of assessing whether a patient is afflicted with breast cancer by examining the correlation between the expression of certain markers and the cancerous state of breast cells. The polynocleotides and encoded polypeptides are potential markers for detecting, diagnosing, monitoring, characterising treating and potentially preventing breast cancer. The polynocleotides and encoded polypeptides are also useful for isolating compounds with cytostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                  polynucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     519 acaggacagccagcgtcatcattgctttgactgatggagaactccatgaagatctctttt 578

The specification also describes TANGO 266, TANGO 261, TANGO 262, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand catotr-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, pulmonary congestion or oedema, emphysema,

AAA75157-59 encode human TANGO 216 proteins. The specification also describes TANGO 266, TANGO 261, TANGO 262, and TANGO 267. The TANGO cellular proliferation, modulate cellular adhesion, modulate cellular adhesion. The polypeptides can be used to modulate cellular adhesion. The discrete extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferation, modulate cellular interactions, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematropoteic associated diseases and disorders, atelectasis, complete renal disorders, intestinal disorders, spleen associated disease, modulate renal disorders, treat cardiovascular disorders such as ischemic heart disorders, intestinal disorders, spleen associated disease, modulate the proliferation, differentiation, as ischemic heart disorders disorders, treat cardiovascular disorders associated diseases or disorder. They may also be used to treat disorders associated diseases or disorder. They may also be used to treat disorders associated with the ovaries, and cerebral oedema, hydrocephalus, brain herniations, latrogenic disease, inflammations, bacterial and viral menhagitis, althemer's Disease, inflammations, bacterial and viral menhagitis, althemer's Disease, inflammations, bydrocephalus and encephalitis, and treat hepatic disorders.

Conterthe present sequence does not appear in the specification; it was not created using information provided.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          543

modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, pulmonary congestion or oedema, emphysema, chronic bronchitis, bronchial asthma and bronchiectasis, intestinal disorders, spleen associated diseases, modulate renal disorders, treat cardiovascular disorders such as ischemic heart disease, modulate the proliferation, differentiation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          and/or function of bone and cartilage cells and to treat bone and/or cartilage associated diseases or disorder. They may also be used to treat disorders associated with the ovaries, and cerebral oedema, hydrocephalus, brain herniations, latrogenic disease, inflammations, bacterial and viral meningitis, Alzheimer's Disease, cerebral choroplasmosis, parkinson's disease, multiple sclerosis, brain cancers, hydrocephalus and encephalitis, and treat hepatic disorders.

note: the present sequence does not appear in the specification; it was
                                                             AAA75157-59 encode human TANGO 216 proteins. The specification also describes TANGO 266, TANGO 261, TANGO 262, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differantiation and/or modulate cellular adhesion. The proteins can be used to tream you Willebrand factor-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions,

SUBCELULAR LOCATION: Type I membrane protein (Probable).
ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; seem to be produced by alternative splicing.
DOMAIN: Binding to PA seems to be effected through the VWA domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transmembrane; Glycoprotein; Signal; Alternative splicing.

                                                                                                         SUBCELLULAR LOCATION: Type I membrane protein.

-!- TISSUE SPECIFICITY: EXPRESSED MODERATELY ON MYELOMONOCYTIC CELL LINES AND SUBSETS OF PERIPHERAL BLOOD LEUKOCYTES AND STRONGIY ON TISSUE-SPECIALIZED CELLS, INCLUDING MACROPHAGES FOAM CELLS WITHIN ATHEROSCLEROTIC PLAQUES, AND ON SPLENIC RED PULP MACROPHAGES.

-!- DOMAIN: THE INTEGRIN I DOMAIN (INSERT) IS A VWFA DOMAIN. INTEGRINS WITH I-DOMAINS TO THE INTEGRIN ALPHA CHAIN FAMILY.

-!- SIMILARITY: CONTAINS 1 VWFA DOMAIN.

-!- SIMILARITY: CONTAINS 7 FG-GAP REPEATS.
"The leukocyte integrin alpha D beta 2 binds VCAM-1: evidence for a binding interface between I domain and VCAM-1.";
J. Immunol. 163:1984-1990(1999).
-!- FUNCTION: INTEGRIN ALPHA-D/ETA-2 IS A RECEPTOR FOR ICAM3 AND VCAM1. MAY PLAY A ROLE IN THE ATHEROSCLEROTIC PROCESS SUCH AS CLEARING LIPOPROPEINS FROM PLAQUES AND IN PHAGOCYTOSIS OF BLOODBORNE PATHOGENS, PARTICULATE MATTER, AND SENESCENT ERYTHROCYTES FROM THE BLOOD.

IT MEDIATES CELL-CELL INTERACTION DURING INFLAMMATORY RESPONSES. IT IS ESPECIALLY IMPORTANT IN MONOCYTE ADHESION AND CHEMOTAXIS.
SUBJUNT: HETERODIMER OF AN ALPHA AND A BETA SUBUNIT. ALPHA-X ASSOCIATES WITH BETA-2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DOMAIN: THE INTEGRIN I-DOMAIN (INSERT) IS A VWFA DOMAIN. INTEGRINS WITH I-DOMAINS DO NOT UNDERGO PROTEASE CLEAVAGE.
SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
SIMILARITY: CONTAINS 1 VMFA DOMAIN.
SIMILARITY: CONTAINS 7 FG-GAP REPEATS.

"The complete primary structure of type XII collagen shows a chimeric molecule with reiterated fibronectin type III motifis, von Willebrand factor A motifs, a domain homologous to a noncollagenous region of type ix collagen, and short collagenous domains with an Arg-Gly-Asp
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            LISSUE SPECIFICITY: TYPE XII COLLAGEN IS PRESENT IN TENDONS, . LIGAMENTS, PERICHONDRIUM, AND PERIOSTEUM, ALL DENSE CONNECTIVE TISSUES CONTAINING TYPE I COLLAGEN. DOMAIN: THIS SEQUENCE DEFINES FIVE DISTINCT DOMAINS, TWO TRIPLE-HELICAL DOMAINS (COLL AND COL2) AND THREE NONTRIPLE-HELICAL DOMAINS (NC1, NC2, AND NC3).

PTW: THE TRIPLE-HELICAL TAIL IS STABILIZED BY DISULFIDE BONDS AT EACH END.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PROLINES AT THE THIRD POSITION OF THE TRIPEPTIDE REPEATING

FUNCTION: INTEGRIN ALPHA-M/BETA-2 IS IMPLICATED IN VARIOUS ADDESIVE INTERACTIONS OF MONOCYTES, MACROPHAGES AND GRANULOCYTES AS WELL AS IN MEDIATING THE UPTAKE OF COMPLEMENT-COATED PREFICLES.
IT IS IDENTICAL WITH CR-3, THE RECEPTOR FOR THE IG3B FRAGMENT OF PERTILE IN G3B. INTEGRIN ALPHA-M/BETA-2 IS ALSO A RECEPTOR FOR FOR FIBRINGEN, FACTOR X AND IAMA. MAPRA-2 PLAY A CRITICAL ROLE IN MAST CELL DEVELOPMENT AND IN IMMUNE COMPLEX-MEDIATED GLOMERULOREPHRITIS. MICE EXPRESSING A NULL MUTATION OF THE ALPHA-M SUBMINI GENE DEMONSTRATE INCREASE IN NEUTROPHIL ACCUMULATION, IN RESPONSE TO A IMPAIRED DEGRANULATION AND PHAGOCYTOSIS, EVENTS THAT

INTEGRINS WITH I-DOMAINS DO NOT UNDERGO PROTEASE CLEAVAGE.
-!- SIMILARITY: BELONGS TO THE INTEGRIN ALPHA CHAIN FAMILY.
-!- SIMILARITY: CONTAINS I VWFA DOMAIN.
-!- SIMILARITY: CONTAINS 7 FG-GAP REPEATS.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING. THE FINAL TISSUE FORM OF COLLAGEN XII MAY CONTAIN HOMOTRIMERS OF EITHER THE LONGER OR THE SHORTER ISOFORM OR ANY COMBINATION OF LONG AND SHORT ISOFORM CHAINS. ONLY THE LONG VARIANT IS A PROTEOGLYCAN. TISSUE SPECIFICITY: HIGHEST EXPRESSION IN TENDONS, PERICHONDRIUM, SKIN, CORNEA, SCIERA, BLOOD VESSELS, AND PERIOSTEUM.

DEVELOPMENTAL STAGE: LONG FORM OF COLLAGEN XII, XIIA, IS THE PREDOMINANT FORM AT EARLY STAGES (DF) AND 11); AT LAATER STAGES OF DEVELOPMENT (EDIS AND 17) THE SHORT FORM, XIIB, BECOMES THE MAJOR PRODUCT, THE LONG SPLICE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 PRINTS; PRO0014; "WINTPELII.

"Murine complement C2 and factor B genomic and cDNA cloning reveals
different mechanisms for multiple transcripts of C2 and B.";
J. Biol. Chem. 265:19040-19046[1990].
-I- FUNCTION: COMPONENT C2 WHICH IS PART OF THE CLASSICAL PATHWAY OF
THE COMPLEMENT SEYSTEM IS CLEAVED BY ACTIVATED FACTOR C1 INTO TWO
FRAGMENTS: C2B AND C2A. A SERINE PROTEASE, THEN COMBINES WITH
COMPLEMENT FACTOR 48 TO GENERATE THE C3 OR C5 CONVERTASE.
-I- CATALYTIC ACTIVITY: CLEAVES C3 IN THE ALPHA-CHAIN TO YIELD C3A AND
C38. CLEAVES C5 IN THE ALPHA-CHAIN TO YIELD C5A AND C5B. BOTH
CLEAVAGES TAKE PLACE AT THE C-TERMINAL OF AN ARGININE RESIDUE.
-I- MISCELLANEOUS: C2 IS A MAJOR HISTOCOMPATIBILITY COMPLEX CLASS-III
                                                                                                                                                                                                                                                                                                                                   -!- SIMILARITY: WITH COMPLEMENT FACTOR B.
-!- SIMILARITY: CONTAINS 3 SUSHI (SCR) DOMAINS.
-!- SIMILARITY: CONTAINS 1 VWFA DOMAIN.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE TRYPSIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              MEROPS; S01.194; -.

CONTAINING FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE CONTAINING FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE CONTAINING FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE SURPACE OF THE FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE SURPACE OF THE FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE SURPACE OF THE FIBRILS, AND THE COL2 AND NG3 DOMAINS MAY BE SURPACE OF THE FIBRILS. I SOFONES: A LONG FORM (SHOWN HERE) AND SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING. THE FINLA TISSUE SHORT FORM; ARE PRODUCED BY ALTERNATIVE OF LONG AND SHORT OF THE SHORTER ISOFONE OF ANY COMBINATIVE OF LONG AND SHORT OF THE SHORTER ISOFONE AND LONG FORM, SHEETAL SHORTER ISOFONE OF STRUCKES.

SHORT AND LONG ISOFONES APPEAR IN AMNION, CHORINON, SKELETAL SHORTE STOND IN LUNG, PLACENTA, KIDNEY, AND A SQUAMOUS CELL COLTAGEN IS FOUND IN LUNG, PLACENTA, KIDNEY, AND A SQUAMOUS CELL CORCINOMA CELL LINE.

CC CARCINOMA CONTAIN SOURCEDED OF THE CHARDEN CELL COLTAGEN CONTAIN C
